

Acceptance Testing

US1 - Registration - 4

- A daily simple functionality that Easy to use
- The button to get to the registration page is too small
- Feels reasonable for a registration page for a small scale application

US2 - Login - 4

- Worked alright since the functionality is pretty simple
- No flaws security wise
- Feels reasonable for a registration page for a small scale application
- Aesthetically needs works

US3 - Viewing Planets/Moons - 3

- The table shows all the planet and moons as intended
- The look is rather basic
- Does it need to display the planet id?

US4 - Planet/Moon Creation - 3

- Creating a moon or planet works well for the most part.
- Too clunky on the top area of home page
- Providing an ID is less scalable than providing the name

US5 - Planet/Moon Deletion - 4

- Simple to do by just putting on the target name
- Deletion from the page is rather quick
- Maybe needs a better indication to show that something is deleted like a small alert on the side?

Sprint Retrospective

What went well

- being able to set up tests relatively easily
- documentation creation went smoothly and helps a lot
- being able to go through the entire pipeline from creating the tests on an excel sheet to putting it in code
- being able to use a new technology

What could be improved on

- Utilize jira more
- Need a better handle on cucumber syntax as it is the most inferring causes of the glitches
- Needing more knowledge of hooks due to not being able to duplicate steps
- Not underestimate the test environment aspect taking so long

What needs to be accomplished

- Finish the jira board
- Needing to debug the test suite some more
- Need to see if actual defects can be detected
